Course Title: Introduction to Basic Chemistry (基礎化學序論)

Purpose/Abstract:
This class is offered to freshmen enrolled in the AMC course. Fundamental knowledge and cutting-edge research in chemistry and materials science will be presented in the form of seminars in each laboratory. Throughout these seminars, the differences in high school-level and college-level chemistry will be emphasized, and students will be given motivation for their future studies.

Goal:
Understanding of the basic fields of university-level chemistry spread over a cross-section of each field, such as organic chemistry, inorganic chemistry, analytical chemistry, biochemistry and physical chemistry.

Contents:
Following the schedule distributed during the initial class, students will visit laboratories to attend seminars and be introduced to laboratory facilities and learn the importance of basic chemistry as well as cutting-edge research.

Books required/referenced:
Indicated by each instructor

Preparation and review:
Indicated by each instructor

Grading:
Class attendance, attitude and activity

Course code/number: SCH-PCH211E

Course Title: Special Class in Basic Chemistry I

Purpose/Abstract:
In this lecture, we try to understand fundamentals of the quantum mechanics and quantum chemistry that are required for advanced chemistry courses. Starting with a lecture of the early quantum mechanics, we learn how to formulate the Schrödinger equation, which is the basic equation of quantum mechanics. The basic concept of wavefunctions (= solutions of the Schrödinger equations) are presented to understand the wave nature of particles in atomic scale. Then the simple models for vibrational and rotational motions of molecules, and the electronic state of the hydrogen atom are treated quantum mechanically as the prototypes for more complex atoms and molecules.

Goal:
Gain the skill to solve simple Schrödinger equations using a problem of a particle in a box. Extend it to solve quantum mechanical problems of the harmonic oscillator and the rigid rotator of diatomic molecules, and the electronic motion of the hydrogen atom.

Contents:
We will cover the following themes.
1. Outline and introduction to elementally physical chemistry
2. Dawn of the quantum theory
3. The classical wave equation
4. The Schrodinger equation
5. A particle in a box
6. General Principles of quantum mechanics
7. The harmonic oscillator and the rigid rotator
8. The hydrogen atom

Books required/referenced:
Textbook: Physical Chemistry - a molecular approach by D.A.McQuarrie and J.D.Simon

Preparation and review:
Read the text book before and after the lectures and try to solve the examples in the textbook.

Grading:
Attendance + Mid-term exam. + Final exam. (+Additional exam)

Remarks:
Course code/number: SCH-INO211E
Course Title: Special Class in Basic Chemistry II (AMC)

Purpose/Abstract:
This course builds from the basic electronic structure of atoms and molecules to bonding in compounds to structure and finally to the relationship between the structure and properties of compounds. It is my aim that students will develop tools needed to predict the properties from the electronic and physical structures of relatively simple compounds.

Goal:
The goal of this course is to learn the basics of electronic structures of atoms and molecules and bonding. In addition, students will be able to understand the relationship among those topics and the properties of compounds.

Contents:
Below is a tentative schedule and content for the course. The schedule may be changed due to time constraints or at the discretion of the professor.
1. Elemental Origin and Atomic Composition
2. Quantum Mechanics
3. Periodic Table General Properties and Periodicity, Magnetic Properties
4. Covalent Bonding, Lewis Structure, Molecular Orbital Method
5. Atoms, Molecule, polyatomic molecules
6. Valence bonding method, hybrid orbital, π bond
7. Molecular structure and polarity
8. Symmetry and group theory
9. Group theory molecular orbital, application to molecular vibration
10. Crystal structure (1)
11. Crystal structure (2)
12. Ionic solids
13. Metal and metal like
14. Electric conduction, semiconductor, superconductivity

Books required/referenced:
Primary text: Inorganic Chemistry 6th Ed, General Chemistry 9th Ed. by Ebbing and Gammon and other texts

Preparation and review:
You should be reading the chapters and trying problems not assigned by the professor.

Grading:
Class attendance, homework, and two exams

Remarks:
breedlove@tohoku.ac.jp

Course code/number: SCH-ORG211E
Course Title: Basic Organic Chemistry I

Purpose/Abstract:
Objective and Summary of Class:
Students will learn how to understand organic chemical reactions. The purpose is to learn the reactions of basic organic compounds, such as alkanes, alkenes, and organic halides, via the flow of electrons shown using arrows.

(1) Structure and Bonding:
(2) Organic Compounds
(3) Stereochemistry
(4) Alkanes
(5) Alkenes
(6) Alkynes

Intended for those students majoring in organic chemistry, this class will provide the broad fundamentals of organic chemistry needed to become a chemist. It is desirable to continue taking Chemistry C, Special Class in Basic Chemistry II, and General Organic Chemistry A, B and C as well as to take Exercises in Organic Chemistry A and Organic Chemistry I A and II A (class concerning spectroscopy)

Goal:
Understanding and mastering the basic properties and knowledge of organic chemistry.

Contents:
Basically, I will give quizzes for each chapter, so please do your best at preparation and review using the textbook.

Books required/referenced:
"Organic Chemistry 9th ed." by John McMurry

Preparation and review:
Preparation / review / tasks are instructed during lecture.

Grading:
Quiz and reports and a final exam. Quizzes will be given at the beginning of classes.

Remarks:
The office hours are basically from 10 am to 5 pm, from Monday to Friday.

Course Title: Special Class in Basic Chemistry IV (AMC)  
Purpose/Abstract:  
This class will cover general analytical and inorganic chemistry, such as equilibria, acids and bases, acid-base equilibria, oxidation and reduction reactions, electrochemistry, etc.  
Goal:  
Students will gain an understanding in basic topics in analytical and inorganic chemistries, which will aid them in their future studies.  
Contents:  
- Contents and Schedule:  
  1. Chemical equilibria  
  2. Acid and bases  
  3. Acid-base equilibria  
  4. Oxidation and reduction  
  5. Introduction to coordination complexes and solubility  
  6. Electrochemistry  
  7. Introduction to symmetry

Course code/number: SCH-PCH221E  
Course Title: Thermodynamics and statistical physics  
Purpose/Abstract:  
In this course, we study thermodynamics, statistical mechanics, and the properties of many-body systems at finite temperature. The course is intended for the understanding both of chemical physical phenomena appeared in material science. We will cover the classical thermodynamics, the relationship between the macroscopic phenomena and the microscopic properties (statistical mechanics), and the application of these ideas to the observed states of actual materials.  
Goal:  
Chemical energetics; entropy; work and reversibility; phase equilibria; solution properties: a statistical approach to chemical energetics and equilibria Introduction to quantum chemistry: applications to the bonding and structure of molecules, materials and nanoparticles. Molecular properties and reactivity  
Contents:  
The following topics will be discussed, each of which takes two weeks.  
- Properties of ideal gases  
- Statistical thermodynamics principles  
- Statistical thermodynamics principles  
- Entropy accounting principles  
- Free-energy functions & the chemical potential  
- Application to multi-phase systems  
- Application to solids, surfaces & nanostructures  
- Fuel cell  
- Topics like as chemical reaction of fuel cells and spin ordering of magnetic materials are both included.  
Books required/referenced:  
Hand out materials based on Physical Chemistry - molecular approach by D.A. McQuarrie and J.D. Simon  
Preparation and review:  
Homework quiz are assigned during class.  
Grading:  
Midterm and Final Examination, plus reports of several classes, and the attendance  
Remarks:

### Course: General Physical Chemistry B (物理化学概論 B)

<table>
<thead>
<tr>
<th>Course code/number</th>
<th>SCH-PCH222E</th>
</tr>
</thead>
<tbody>
<tr>
<td>Course Title</td>
<td>General Physical Chemistry B</td>
</tr>
<tr>
<td>Purpose/Abstract</td>
<td>The course deals with the introduction to the principles of quantum mechanics and their application to chemical systems. Topics include the formalism and mathematical tools of quantum mechanics; approximate methods; atomic structure: the chemical bond, valence bond; and molecular orbital theory.</td>
</tr>
<tr>
<td>Goal</td>
<td>The aim of this course is that students are able to: (1) understand approximation methods, including the variational method and perturbation theory; (2) learn the atomic structures and their spectroscopic properties; (3) understand the quantum mechanical description of the chemical bond and molecular structures; and (4) be familiar with the concept of molecular orbital theory.</td>
</tr>
</tbody>
</table>
| Contents           | The contents and scope are as shown in below:  
  1. Introduction  
  2. Approximation method in quantum mechanics: Variational method  
  3. Approximation method in quantum mechanics: Perturbation theory  
  4. Structure of the helium atom  
  5. Multiple electron atoms and the Pauli principle  
  6. Non-diatomic molecules: term symbol and atomic spectra  
  7. Chemical bond: the hydrogen molecular ion  
  8. Chemical bond: The molecular orbital method  
  9. Chemical bond: the structure of diatomic molecules  
  10. Bonding in polyatomic molecules  
  11. Hybridization and molecular structure  
  12. Conjugated pi-electron systems: The Hückel molecular orbital method  
  13. Computational quantum chemistry |
| Books required/referenced | Physical Chemistry - a molecular approach by D.A. McQuarrie and J.D. Simon |
| Preparation and review | The session time is limited and therefore self-directed learning is important. Students are required to prepare and review for each class. |
| Grading            | Students are evaluated on their class attendance, the midterm report, and the final examination. |
| Remarks            | |

### Course: General Physical Chemistry C (物理化学概論 C)

<table>
<thead>
<tr>
<th>Course code/number</th>
<th>SCH-PCH223E</th>
</tr>
</thead>
<tbody>
<tr>
<td>Course Title</td>
<td>General Physical Chemistry C</td>
</tr>
<tr>
<td>Purpose/Abstract</td>
<td>Chemical kinetics, also known as reaction kinetics, is the study of the speed of chemical processes. A study of chemical kinetics includes investigations of how experimental conditions can influence the speed of a chemical reaction. In this class, appropriate construction of mathematical models that can describe the characteristics of a chemical reaction will be discussed. Concept of “order of reaction” and “how to determine order of reaction along with integrated rate laws” are also the most important topics of this class. Moreover, the enzymatic reaction kinetics will be introduced to understand the specific examples of chemical reaction rate determination. Through the trial to solve the problems in the textbook, the establishment of the knowledge will be achieved.</td>
</tr>
<tr>
<td>Goal</td>
<td>The main goal is to teach principles of reaction kinetics and catalysis. Topics covered include the laws and theories governing reaction rates and mechanisms in gas, condensed phase and at the solid-liquid interface. Modern experimental approaches to study kinetics in complex chemical and biochemical systems and analysis of experimental data will be introduced. Approaches for the Estimation of the rate constants of chemical reactions will be also discussed.</td>
</tr>
</tbody>
</table>
| Contents           | Contents and Progress Schedule of the Class:  
  In this class, the contents from Chapter 27 to Chapter 31 of the textbook (Physical Chemistry - a molecular approach by D. A. McQuarrie and J.D. Simon) will be discussed.  
  Chapter 27 / The Kinetic Theory of Gases  
  Chapter 28 / Chemical Kinetics : Rate Laws  
  Chapter 29 / Chemical Kinetics : Reaction Mechanisms  
  Chapter 30 / Gas-phase Reaction Dynamics  
  Chapter 31 / Solid and Surface Chemistry |
| Books required/referenced | Textbook and References: Physical Chemistry - a molecular approach by D. A. McQuarrie and J.D. Simon |
| Preparation and review | Students who joins in this class is expected to keep prep. |
| Grading            | Record and Evaluation Method:  
  Class attendance (perfect attendance is 60 points), reports (perfect submission is 20 points) and scores of final examinations (full score is 20 points) are totally evaluated.  
  Person who gains over 80 points gets AA score. |
<p>| Remarks            | |</p>

### Course: General Inorganic and Analytical Chemistry A (無機分析化學概論 A)
- **Semester/Credits:** 4 Semester 2 Credits
- **Instructor:** 宇田 聡
- **Affiliation:** Laboratory of Crystal Chemistry

**Course code/number:** SCH-INO221E

**Course Title:** General Inorganic and Analytical Chemistry A (無機分析化學概論 A)

**Purpose/Abstract:**
Thermodynamics is a powerful tool to understand the equilibrium phase relationship that is needed for materials processing including materials synthesis and growth from the conventional to the most advanced one. It also gives an insight of the nonequilibrium process in terms of the deviation from the equilibrium state. It should be also noted that thermodynamics is a powerful mean to prove your developing theory.

Although thermodynamics is one of the classic academics, it is not easy to learn. This is because the ‘practical state’ is often far different from the ‘ideal’ and only ideal-gas case with mathematical expressions are simply demonstrated in teaching without showing its applications to the ‘real world’. In this class, students will have an exciting learning experience of the thermodynamics through its practical applications with simple math forms. In addition, this class is linked to the ‘Exercises in Inorganic and Analytical Chemistry A’ and students will learn about the practical use of thermodynamics by solving a few kinds of problems associated with chemical equilibrium or chemical reactions.

**Goal:**
- Learn 1st law and 2nd law of Thermodynamics.
- Learn different kinds of free energy and how they are related by the Legendre transformation.
- Learn the basic concepts of Gibbs free energy, partial molar quantity.
- Learn the derivation of chemical potentials to understand the phase relationship.
- Learn how to read equilibrium phase diagrams.
- To get the idea how to apply the thermodynamics to phase equilibria and reaction process in materials synthesis and growth process.

**Contents:**
I. Scope of Thermodynamics
   II. 1st law and 2nd law of Thermodynamics
   III. Equilibrium
   IV. Chemical Potentials and Activities
   V. Phase Diagrams
   VI. The Kinetics of Phase Transformations

**Books required/referenced:**
Handout will be given before the class begins.

**Preparation and review:**
Assignments will be given.

**Grading:**
The results of class attendance, quizzes and examination will be used for evaluation.

**Remarks:**

**Course Title**: General Inorganic and Analytical Chemistry C (AMC)  
**Purpose/Abstract**:  
The objective of this class is to introduce frontiers of inorganic chemistry. The aim of the class is to show how developments in inorganic chemistry impinge on the other disciplines, such as life science, condensed matter physics, and materials chemistry. We will discuss materials chemistry focusing on solid-state compounds, their structures, and electronic, magnetic, and optical properties. In addition, we will discuss nanomaterials and biosensors and introduce the area of catalysis.

**Goal**:  
Students will gain an understanding of the properties of solid-state materials and nanomaterials and learn about f-block elements. In addition, you will learn basic concepts of catalysis and biosensors.

**Contents**:  
- Basic Contents and Schedule:  
  1. f-block elements  
  2. Introduction to catalysis  
  3. Homogeneous catalysis  
  4. Heterogeneous catalysis  
  5. Other catalytic systems (e.g., photocatalysis and electrocatalysis)  
  6. Biological inorganic chemistry  
  7. Biological inorganic processes  
  8. Band structures of solids and semiconductors  
  9. Magnetic properties of solids  
  10. Electronic properties of solids  
  11. Optical properties of solids  
  12. Solid-state and materials chemistry

<td>General Organic Chemistry A (有機化學概論 A)</td>
<td>4 Semester 2 Credits</td>
<td>水上 進</td>
<td>Cell Functional Molecular Chemistry</td>
</tr>
</tbody>
</table>

**Course code/number**: SCH-ORG221E

**Course Title**: General Organic Chemistry A

**Purpose/Abstract**:
Objective and Summary of Course:
This class is part of organic chemistry classes, including Special Class in Basic Chemistry II, and General Organic Chemistry A, C, and D. The lecture covers the following topics:
1. Basic chemistry of organic halides.
2. Nucleophilic substitution reactions and reaction theory
3. Diene and allicy systems
4. Conjugated and aromatic compounds
5. Aromatic substitution reactions
6. Properties of alcohols, phenols, ethers, and thiols.
This class will provide the broad fundamentals of organic chemistry that are essential for students to become a chemist.

**Goal**:
Goal of Study:
To understand
1. Properties of alkyl halides and related compounds, synthetic methods, radical reactions, principles of the stability of alkyl radicals, the characteristics of Grignard reactions
2. Reactions of organic compounds, especially the characteristics and reaction mechanisms of nucleophilic substitutions and aliphatic reactions
3. Stability of conjugated chains, electrophilic reactions, kinetic and thermodynamic control of reactions, and the characteristics of Diels-Alder reactions
4. Structure of benzene and its derivatives, the principles of aromatic stability, heterocyclic aromatic compounds, the Hückel rule, and electrophilic substitution reactions
5. Chemical properties and reactivity of alcohols, phenols, epoxides, and thiols

**Contents**:
The class will involve chapters 10, 11, and 14-18 of Organic Chemistry 9th Ed. by John McMurry. However, the parts in chapter 14 covering spectroscopy will be omitted.
1. Introduction
2. Organohalides (Chapter 10)
3. Nucleophilic substitutions and eliminations (Chapter 11)
4. Conjugated compounds (Chapter 14)
5. Benzene and aromaticity (Chapter 15)
6. Electrophilic aromatic substitution (Chapter 16)
7. Alcohols and phenols (Chapter 17)
8. Ethers and epoxides: Thiols and Sulphides (Chapter 18)

**Books required/referenced**:
McMurry Organic Chemistry 9th Ed.

**Preparation and review**:
Problem-solving exercise

**Grading**:
Evaluation will be performed on the basis of exams, class participation, and homework results.

**Remarks**:

### General Organic Chemistry C (有機化学概論 C)
- **Semester/Credits**: 5 Semester, 2 Credits
- **Instructor**: 鬼塚 和光
- **Affiliation**: Synthesis of Organic Functional Molecules

**Course code/number**: SCH-ORG223E

**Course Title**: General Organic Chemistry C (AMC, Chemistry of Carbonyl Compounds)

**Purpose/Abstract**: Learning the chemistry of carbonyl compounds - main reactions, methods of synthesis, reaction mechanisms and synthetic applications.

**Goal**: Understanding the chemistry of carbonyl compounds.

**Contents**: Lectures based on the textbook, discussions in the class, tests
- Chapter 19 Aldehydes and Ketones: Nucleophilic Addition Reactions
- Chapter 20 Carboxylic Acids and Nitriles
- Chapter 21 Carboxylic Acid Derivatives
- Chapter 22 Carbonyl Alpha-Substitution Reactions
- Chapter 23 Carbonyl Condensation Reactions

**Books required/referenced**: McMurry-Organic Chemistry: chapters 19-23

**Preparation and review**: Reading the textbook, self-training in writing reaction mechanisms

**Grading**: Attendance of the class, activity in the discussions, tests results

**Remarks**:

---

### General Organic Chemistry D (有機化学概論 D)
- **Semester/Credits**: 5 Semester, 2 Credits
- **Instructor**: 永次 史
- **Affiliation**: Synthesis of Organic Functional Molecules

**Course code/number**: SCH-ORG224E

**Course Title**: General Organic Chemistry D

**Purpose/Abstract**: Objective and Summary of Class:
- This class is part of series of organic chemistry classes, including General Organic Chemistry A, C, and D.
- This lecture will concern the following topics:
  1. Basic chemistry of amines and heterocycles
  2. Chemistry of biomolecules
    - 2-1 Carbohydrates
    - 2-2 Amino acids, Peptides and Proteins
    - 2-3 Lipids
    - 2-4 Nucleic acids
  3. The organic chemistry of metabolic pathway
  4. Pericyclic reactions: electrocyclic reactions, cyclo additions and sigmatropic rearrangements

**Goal**:
- Goal of Study
  1. To understand the synthetic method of amines and reactions of amines
  2. To understand the chemical properties and reactivity of heterocyclic amines
  3. To understand the structures and biological functions of biomolecules (carbohydrates, amino acids, peptides, proteins, lipids and nucleic acids)
  4. To understand the organic chemistry of metabolic pathway in the cells of living organisms
  5. To understand the peicyclic reactions by molecular orbital theory

**Contents**:
- The class will involve chapters 24–30 of Organic Chemistry by John McMurry.

**Books required/referenced**:

**Preparation and review**:
- They should do the homework, which is assigned in the class. In addition, they should do the exercise in the text book.

**Grading**:
- Record and Evaluation Method:
  - Evaluation will be performed on the basis of exam and the homework results.

| Exercises in Organic Chemistry A (有機化学演習 A) | 4 Semester  
1 Credit | 永次 史  
水上 進  
和田 健彦 | Institute of Multidisciplinary Research for Advanced Materials |

**Course code/number:** SCH-ORG251E  
**Course Title:** Exercises in Organic Chemistry A  
**Purpose/Abstract:**  
Objective and Summary of Class:  
Understanding of organic chemistry will be deepened by performing exercises based on the lecture contents of “Chemistry C” and “Special Class in Basic Chemistry III” and in parallel “General Organic Chemistry A” and “Laboratory Experiments in Chemistry A” (up to chapter 18 in McMurry, “Organic Chemistry”, 8th ed.)  
**Goal:**  
It will be possible to explain basic organic chemistry in real terms. In particular, organic reaction mechanisms can be described with arrows showing the movement of electrons.  
**Contents:**  
The problems at the end of each chapter of McMurry’s “Organic Chemistry”, 8th ed. up to chapter 18 will be performed. Details will be explained during the 1st lecture.  
**Books required/referenced:**  
McMurry “Organic Chemistry”, 8th ed. and 9th ed. References will be introduced accordingly.  
**Preparation and review:**  
You should study the exercise in the McMurry’s “Organic Chemistry”, 8th ed. (chapters 1–18)  
**Grading:**  
Evaluation will be based on attendance and the number of exercise answers given. Additional points will be given for answers written on the blackboard.  
**Remarks:**

**Preparation and review:**  
You should study the exercise in the McMurry’s “Organic Chemistry”, 8th ed. (chapters 19–29).  
**Grading:**  
Evaluation will be based on attendance and the number of exercise answers given. Additional points will be given for answers written on the blackboard.  
**Remarks:**
Course Code/Number: SCH-BIC211E
Course Title: General Biochemistry (生物化学概論)

Purpose/Abstract:
To study the basic knowledge of molecular biology, biochemistry and structural biology and to understand biological phenomena at the molecular level, students will learn the following contents.
1. Structures and chemical properties of nucleic acids
2. Structures and chemical properties of amino acids and proteins
3. Biochemical methods for analyzing DNA sequence, amino acid sequence, protein structures and functions
4. Mechanisms of enzyme catalysis

Goal:
Students will gain deep insights into structures and physiological functions of nucleic acids, proteins and other important biomolecules. Also, students will understand molecular mechanisms of several important enzymes.

Contents:
Lectures will follow a textbook indicated below. Especially, we will learn Chapters 1-9 of the textbook.

Books Required/Referenced:
Berg, Tymoczko and Stryer, Biochemistry, 7th international edition.

Preparation and Review:
A short test will be given as a homework in the end of every class.

Grading:
Attendance, attitude in class and results of examinations will be taken into consideration for grading.

Remarks:

---

Course Code/Number: SCH-BIC221E
Course Title: The Molecular Design of Life and Biological Energy Transduction

Purpose/Abstract:
To learn the biological phenomena at the molecular level and to gain a deeper understanding of biochemistry, molecular biology and biophysics. Students will learn:
1. Structures and properties of sugars and lipids.
2. Structures and properties of biological membranes.
3. Biological energy transduction.

It is desirable to consistently attend the discussions in Biochemistry II A concerning the DNA and RNA synthesis and metabolism of biomolecules.

Goal:
Students will gain an understanding of the functions of sugars, polysaccharides, lipids and membranes on the basis of their structures and thermodynamics. In addition, students will understand the process in which glucose is converted into ATP as energy currency.

Contents:
1st lecture Carbohydrates I
2nd lecture Carbohydrates II
3rd lecture Lipids and cell membranes I
4th lecture Lipids and cell membranes II
5th lecture Membrane Channels and Pumps I
6th lecture Membrane Channels and Pumps II
7th lecture Signal Transduction Pathways
Mid-term test
8th lecture Metabolism: Basic concepts and Design
9th lecture Glycolysis and Gluconeogenesis I
10th lecture Glycolysis and Gluconeogenesis II
11th lecture The Citric Acid Cycle
12th lecture Oxidative Phosphorylation I
13th lecture Oxidative Phosphorylation II
Final test
14th lecture Epilogue: Lives of Warburg, Mayerhoff and Krebs

Books Required/Referenced:
Berg, Tymoczko, Gatto and Stryer, Biochemistry, 9th edition (WH Freeman). The lectures will cover chapters 10 to 18 of the textbook.

Preparation and Review:
Students will be asked to submit homework every week.

Grading:
The results of examinations and attendance will be taken into consideration for evaluation.

Remarks:
The contact address of Satoshi Takahashi is as follows:
IMRAM, east building 1, room 307 (Katsurahara Campus). Email: satoshi.takahashi.66@tosoku.ac.jp
Students are welcome to visit my office. Please make an appointment by email.

**Course code/number**: SCH-OCH251E  
**Course Title**: Laboratory Experiments in Basic Chemistry  
**Purpose/Abstract**: You learn experimental operations of basic inorganic chemistry, basic analytical chemistry, basic physical chemistry, and basic organic chemistry.  
**Goal**: You can make fundamental experiments of basic inorganic chemistry, basic analytical chemistry, basic physical chemistry, and basic organic chemistry.  
**Contents**:  
1. Basic operations  
   - Calibration of volumetric measuring instruments  
2. Titrations  
   - Neutralization titration  
   - Precipitation titration  
   - Oxidation-reduction titration  
   - Complexometric titration  
   - Neutralization titration curves and acid dissociation constants of weak acids  
3. Analyses of absorption spectra using UV-vis spectrophotometer  
4. Measurement of enthalpy changes in neutralization and dissolving salts  
5. Syntheses of organic compounds  
   - Synthesis of 6,6-nylon from cyclohexene  
   - Synthesis of Aspirin  

**Books required/referenced**: Textbooks (directions for the experiments) will be given in the class; other references are shown in the directions.  
**Preparation and review**: Read the textbook and draw a flow chart of the experiment, in advance.  
**Grading**: Evaluation will be performed by your attendance records and laboratory reports.

**Course code/number:** SCH-INO303E  
**Course Title:** Electronic Properties of Inorganic Materials  
**Purpose/Abstract:** Properties of solid are mainly dominated by an electronic structure of material. In this class, we will learn how to understand the atomic bonds, which form a crystal structure, and electric properties such as electrical conductivity of materials based on the electronic structure.

**Goal:** The goal of this class is to understand the relationship between electronic structure and atomic bond/electrical conductivity of solid. One will understand the classification of atomic bonds and the definition of metal and insulator that based on an electronic structure.

**Contents:**
1. Introduction  
   (crystal structure, X-ray diffraction)  
2. Bonding character in crystal  
   (Relationship between atomic bonding character and crystal structure)  
3. Quantum-mechanical treatment of atomic bond  
   (Molecular orbital, LCAO-approximation, Hückel method)  
4. Band Theory  
   (Expansion of molecular orbital to crystal)

**Books required/referenced:**  
The Electronic Structure and Chemistry of Solids (P.A. Cox, OXFORD), Transition Metal Oxides (P. A. Cox, OXFORD), Electronic Structure and The Properties of Solids (W. A. Harrison, Dover), etc.

**Preparation and review:**  
The session time is limited and therefore self-directed learning is important. Students are required to review for each class.

**Grading:**  
Class attendance and examination

**Course code/number:** SCH-INO304E  
**Course Title:** Inorganic Chemistry I B  
**Purpose/Abstract:** When we synthesize materials, we should refer to phase diagrams. Phase diagrams are one of the most important sources of information concerning the behavior of elements, compounds and solutions. They give us information of phase composition and phase stability as a function of temperature, pressure and composition. The course is intended to understand the principles of phase diagrams.

**Goal:** The goal of this class is to understand and familiarize with binary and ternary phase diagrams.

**Contents:**
1. Introduction  
   (Basics for thermodynamics)  
2. Phase equilibria and phase diagrams  
   (One component phase diagram, Phase rule and equilibrium)  
3. Phase diagrams of two-component systems  
   (Solid solutions, Construction of equilibrium phase diagrams of two-component systems, Cooling curves)  
4. Interpretation of phase diagrams  
   (Phase composition, The Lever rule)

**Course code/number:** SCH-INO305E  
**Course Title:** Inorganic Chemistry II A  
**Purpose/Abstract:**  
Topics will include the structure and mechanical and physical properties of supramolecular complexes and multi-dimensional framework systems. Each topic assigned to you should be pre-investigated before your presentation. We will get various knowledges on the basic science in the field of supramolecular complexes and multi-dimensional framework systems through our presentation and discussion.  
**Goal:**  
The goal of this course is to gain an understanding of supramolecular chemistry and multi-dimensional framework systems and related chemistry.  
**Contents:**  
After discussion about the basics of supramolecular chemistry and its related chemistry, students will present a topic involving supramolecular chemistry or other related chemistry for discussion by the class.  
**Books required/referenced:**  
Steed and Atwood, Supramolecular Chemistry, 2nd Ed. Wiley, and others  
**Preparation and review:**  
Prepare a lecture and discussion on a topic supramolecular chemistry and related chemistry such as multi-dimensional networks and their physical properties  
**Grading:**  
Attendance and in-class discussions will be used to evaluate the students’ progress.

**Course Title:** Physical Chemistry II A  
**Purpose/Abstract:**  
To understand basic principles of electron paramagnetic resonance (EPR) and to learn its application to studies of molecular science (structures, electronic states, dynamics and etc.).  
**Goal:**  
Subjects to be learned  
1. Properties of a spin angular momentum.  
2. How magnetism is explained by electron spin.  
3. Basic principles of magnetic resonance phenomenon  
5. Microwave and other experimental techniques used in EPR.  
6. Some of advanced techniques in EPR: pulse method, double resonances, high-field and high-frequency methods, and time resolved measurements  
**Contents:**  
1. Properties of a spin angular momentum.  
2. Several types of magnetism and role of electron spin.  
3. Basic principles of magnetic resonance phenomenon  
4. Magnetic interactions of electron spin: Interactions with static field, nuclear spins and electron spins  
5. Experimental techniques used in EPR.  
6. Some of advanced techniques in EPR: pulse method, double resonances, high-field and high-frequency methods, and time resolved measurements  
90 minutes for each subject.

**Course code/number**: SCH-OCH301E  
**Course Title**: Polymer Chemistry I  
**Purpose/Abstract**:  
The category of polymer (or macromolecular) materials is so wide, for example, familiar fiber (or textile), rubber, plastics, and photo-resist to fabricate semiconductor integrated circuit (IC). Protein and nucleic acid are also a kind of polymer, so-called biopolymer.  
In this lecture, synthesis, structure, and properties of polymers will be first introduced, which is considerably different from the case of ordinary organic low-molecular weight compounds. Next, high-performance and functional polymers, and hybrid polymer materials will be explained in detail. In addition, biopolymer will be summarized from the viewpoint of biophysics.  
**Goal**:  
Aiming at making the backbone in the specific fields of advanced materials science in nano-science and nanotechnology through basic understanding for polymer material chemistry.  
**Contents**:  
1. Basic Principles  
2. Molecular Weight and Polymer Solutions.  
3. Chemical Structure and Polymer Morphology  
4. Chemical Structure and Polymer Properties  
5. Evaluation, Characterization and analysis of Polymers.

The final grade in this course will be based on the final exam, quizzes, attendance, and active participation.  
**Remarks:**  
The contact address of Hiroshi KADOKURA  
Office: Laboratory of Biomolecular Structure, IMRAM  
South Multidisciplinary Research Laboratory Building 1, Room 508, Katahira Campus  
Email: hiroshi.kadokura.b9@tohoku.ac.jp

**Course code/number:** SCH-OCH302E  
**Course Title:** Polymer Chemistry II  
**Purpose/Abstract:**  
The category of polymer (or macromolecular) materials is so wide, for example, familiar fiber (or textile), rubber, plastics, and photo-resist to fabricate semiconductor integrated circuit (IC). Protein and nucleic acid are also a kind of polymer, so-called biopolymer.  
In this lecture, synthesis, structure, and properties of polymers will be first introduced, which is considerably different from the case of ordinary organic low-molecular weight compounds. Next, high-performance and functional polymers, and hybrid polymer materials will be explained in detail. In addition, biopolymer will be summarized from the viewpoint of biophysics.  
**Goal:**  
Aiming at making the backbone in the specific fields of advanced materials science in nano-science and nanotechnology through basic understanding for polymer material chemistry.  
**Contents:**  
1. Free Radical Polymerization  
2. Ionic Polymerization  
3. Vinyl Polymerization with Complex Coordination Catalysts  
4. Step-reaction and Ring-opening Polymerization  
**Books required/referenced:**  
**Preparation and review:**  
The session time is limited and therefore self-directed learning is important. Students are required to review for each class.  
**Grading:**  
Attendance and regular examination  
**Remarks:**
